

PEDAL SWITCHER AND COMMANDER COPY (Both Discontinued)

Use the effects you want without ruining your tone

Designed to sit on your pedalboard, Pedal Switcher uses 4 true bypass loops to send your signal only to the pedals you're using. "On a traditional pedalboard, even when the effects are off, your signal still goes through numerous tone-trashing buffers, solid-state switches and patch cables," explained Josh Fiden, CEO/Founder, Voodoo Lab. "Pedal Switcher uses true bypass gold relays sealed in nitrogen, so no matter how many pedals you use, your tone stays pure and dynamic," said Fiden.

Pedal Switcher also features 4 instant access switches, buffered and non-buffered inputs, and a TRS insert for putting devices like a volume pedal between effects. Loops can also be used as a mute for silent tuning onstage, and A/B amp switching. "So many guitar players love the guitar-cable-amp sound, but also have a pile of great stompboxes that they wish they could use without destroying the purity of their sound," said James Santiago, VP Marketing/Product Development, Voodoo Lab. "Now you have the freedom to use any pedals you want, and never have to worry that the buffer in your overdrive is killing the tone of your ultra-sensitive vintage fuzz," explained Santiago.

Voodoo Lab's Commander can control an unlimited number of Pedal Switcher units allowing you to store combinations of pedals. "With a single footswitch, you can go from a distorted lead with delay, to straight guitar-cable-amp tone without ever missing a note," said Fiden. Commander features 10 user customizable presets and is phantom powered by the Pedal Switcher. "With Pedal Switcher and Commander, you can build your ultimate pedalboard and sound better, stomp less, and play more!"
